01 INTRODUCTION

In today's competitive café industry, delivering a top-notch customer experience is essential. As customer expectations evolve, integrating technology has become vital. The "Bean and Beyond Café Ordering System" is designed to streamline the ordering process, making it more efficient, engaging, and convenient for customers.

The system allows customers to place orders effortlessly, whether online or in-store, offering features like menu browsing, item selection, and personalization. This convenience boosts satisfaction and encourages repeat visits.

For staff, the system simplifies order management by consolidating tasks into a real-time, user-friendly interface. By reducing miscommunication and inefficiencies, it enables employees to focus on providing excellent service, even during busy hours.

02 PROBLEM STATEMENT

- i. Inefficient Ordering Process
- ii. Lack of Customization Options
- iii. Limited Staff Coordination

03 OBJECTIVES & SCOPES

1) To ensure the system's usability and reliability through thorough testing, guaranteeing a seamless user experience for both customers and administrators.

2) Improve menu management efficiency.

3) Provide a seamless user experience.

Target users

- Staff
- Customers

Modules

- User authentication
- Product management
- Product browsing
- Shopping cart
- Payment management
- Feedback management
- Report management

04 ERD

05 DEMO

06 CONCLUSION, LIMITATION, AND FUTURE IMPROVEMENT

Conclusion

The system effectively manages ordering, reporting, and user authentication for customers and staff. It provides role-specific functionalities, secure login mechanisms, and report generation features. While functional, the system needs enhancements to improve scalability, security, and flexibility.

Limitations

While the system performs well, it has certain limitations. The use of raw SQL queries introduces potential security vulnerabilities, such as SQL injection, which could compromise data integrity. Additionally, as the database grows, the system may face performance challenges due to the lack of optimized query handling and indexing. Furthermore, the error feedback is limited, offering basic information that may not fully assist in diagnosing issues during development or maintenance.

Future Improvements

To address these limitations, the system could adopt parameterized queries or prepared statements to mitigate security risks and improve data protection. Enhancing query optimization and introducing indexing mechanisms would significantly improve scalability and performance for larger datasets. Finally, implementing detailed logging and advanced error reporting would provide better diagnostic tools for developers and more informative feedback for users, ensuring a more robust and maintainable system.

THANK YOU!

Have a nice day ahead!
